Dear Headspace Hiring Team,

Transforming mental healthcare requires knowing what actually helps — and that's a measurement problem. I've spent 8+ years building experimentation and analytics frameworks that turn ambiguous questions into evidence-based product decisions. Headspace's mission to improve the health and happiness of the world resonates deeply, and I want to bring analytical rigor to a team where the outcomes genuinely change lives.

As a Lead Product Data Analyst / Data Scientist at Vanguard, I architected the experimentation framework from scratch — designing and executing 20+ A/B tests using power analysis, staggered difference-in-differences, and propensity score matching. One initiative alone generated 19,000 new accounts in a single month (~\$665M in new deposits, est. \$10M+ annualized revenue). I also built the KPI frameworks and self-serve Looker/Tableau dashboards that leadership now uses for quarterly goal-setting — replacing ad-hoc requests with scalable measurement infrastructure.

Before Vanguard, I spent 2+ years at Deloitte Consulting leading causal inference and A/B testing for large-scale product rollouts — including non-inferiority experiments for a financial web platform redesign. At Genentech, I built ML pipelines and developed a CNN-based image quality system that became a US patent (approved 2025). Across 8+ years and four companies, I've consistently operated at the intersection of experimentation, product strategy, and cross-functional leadership.

I'm drawn to the Manager, Data Analytics role at Headspace because it combines the strategic problem-solving and analytical depth I thrive in with a product and mission I believe in. I'm looking for a place where experimentation rigor and data literacy aren't afterthoughts but core to how decisions get made — and Headspace clearly fits that bar.

I'd welcome the chance to discuss how my experience can contribute to your team.

Best regards,

Chetan Kulkarni
